The Global Partnership for Effective Development Co-operation (Global Partnership) supports the implementation of the effectiveness principles. Its flagship instrument – the global monitoring exercise – helps country governments and development actors assess progress, opportunities and obstacles to achieving more effective development co-operation.

This profile provides a snapshot of Italy’s results from the two most recent Global Partnership monitoring rounds (2018 and 2016). When relevant, 2018 results are compared to the 2018 average results of the Development Assistance Committee (DAC). The Global Partnership monitoring process and framework have been revised, and the new exercise will be launched at the 2022 Effective Development Co-operation Summit. The next round will take place from 2023 to 2026. This profile will be updated periodically as new data is generated by the monitoring exercise.

Use of country-owned results frameworks and planning tools (SDG 17.15.1)

Global Partnership monitoring provides evidence to report on Sustainable Development Goals (SDGs) indicator 17.15.1. It assesses whether development partners’ interventions: draw objectives from national development strategies; draw indicators from country results frameworks; and use government data and statistics for monitoring.

Italy used country-owned results frameworks and planning tools (SDG 17.15.1) to a medium extent in 2018, an increase when compared to 2016, and above the DAC average. In 2018, 94% of the objectives of new development co-operation projects and programmes aligned to those defined in partner country strategies/plans. However, 57% of results indicators of new projects and programmes were drawn from partner country-owned results frameworks and 54% of these results indicators were monitored using data from government monitoring systems and statistics.

Untied ODA

Untying ODA – removing the legal and regulatory barriers to open competition for aid-funded procurement – is an important enabler of partner country ownership over the allocation of resources to address their development priorities.

In 2018, the share of untied aid for Italy was 92%, a decline since 2016. This percentage is higher than the DAC average.

Transparency of development co-operation

Transparency is a precondition for trust and accountability and is critical for building inclusive partnerships. Global Partnership monitoring provides information on the quality of development partners’ reporting to international transparency systems and standards: the OECD Creditor Reporting System (CRS), the OECD Forward Spending Survey (FSS), and the International Aid Transparency Initiative (IATI).

Italy’s quality of reporting to FSS has remained good, between 2016 and 2018. However, the quality of reporting to CRS has declined. The quality of reporting to IATI was low in 2018.

1 Official Development Assistance
2 This data is generated from the OECD Creditor Reporting System. Untied ODA figures refer to all bilateral ODA excluding providers’ administrative costs and in-donor refugee costs. The 2016 figure refers to disbursements for the year 2015; the 2018 figure refers to disbursements for the year 2019 (updated with the most available data since the 2018 Monitoring Round).
3 For CRS, 2018 refers to the assessment of reporting to CRS in 2017, and 2016 to the assessment of reporting in 2014. For FSS, 2018 refers to the 2018 FSS survey, and 2016 refers to the 2015 survey. For IATI, 2018 refers to scores extracted in December 2018, and 2016 refers to scores extracted in May 2016.
Use of countries’ public financial management (PFM) systems

Use of countries’ PFM systems allows for better integration of development co-operation programmes with countries’ broader planning, budgeting and financial management systems. It can reduce duplications of effort, boost the leveraging effect of development co-operation resources, and increase the sustainability of results.

Italy uses partner countries’ PFM systems to a larger extent compared to the DAC average. In 2018, 94% of funding disbursed to the public sector used countries’ PFM systems, an increase when compared to 2016. The largest increase was observed in the use of auditing procedures.

Predictability of development co-operation

The provision of timely information on development co-operation helps governments plan and manage resources and enables development partners’ co-ordination.

The proportion of funding disbursed to the public sector within the scheduled fiscal year – annual predictability - was 58% in 2018, which is the same as in 2016, and below the DAC average. The extent to which partner country governments receive indicative forward expenditure or implementation plans – medium-term predictability – was 26% in 2018, a decline since 2016, and below the DAC average. The share of development co-operation funding recorded on partner countries’ national budgets was 79% in 2018, which is an increase in comparison to 53% in 2016.
